/s/ Mathew Lyons, SCE DARD DWG NO. 7.Seed all disturbed areas at the rates given in Virginia Construction Specification VA-706. Seeding: page VA-706-35.Install cutoff valves near the source of the water and near any tees in the pipeline to allow control of water 1.Install all pipelines according to the Virginia Pipeline Conservation Practice Standard (516), and Virginia Construction Specification Plastic (PVC, PE) Pipe (VA—745). 6.Install a backflow preventer to prevent flow back into the well from any watering facilities. flows. Enough valves shall be installed in the line to regulate flows through the pipeline. Valves should be installed in housing that are weather proof, well drained, and easily accessible. They must also be protected 4.All pipelines with gravity flows shall be graded using a surveyors level to prevent low places in the pipelines. Low places in the pipeline will cause the pipeline to air lock and not flow. to prevent caving after construction. selected material free of rocks 3 inches or larger. The pipeline shall be pressure tested at the working head. Repair any leaks and repeat the test. All fill for underground pipes shall be compacted to the degree required pipeline shall be protected from freezing and crushing. 2.All pipelines shall be installed a minimum of two feet in the ground, if possible. Where not possible the Construction Notes: 3.The pipe trench shall be free of loose rocks before installing the pipeline. In rocky soils, bed the pipe in water—meter boxes, concrete casing, or other suitable housing. from livestock. High quality ball valves are recommended. Valves installed in the field may be housed in If seeding is done outside recommended seeding dates, a nurse crop is to be used.
